

Grid WRF Portal: On Demand Weather Forecast Visualization via Efficient Resource Utilization in Grid Computing

Presenter: Khalid Saleem
Florida International University

**Team: Khalid Saleem, Shu-Ching Chen, S. Masoud Sadjadi, Javier
Munoz, Diego Lopez, Selim Kalayci, David Villegas, Juan Carlos
Martinez**

SuperComputing 2007

Overview

- Motivation
- Proposed Research
- Major Research Issues
- System Overview
- Q & A

Motivation(1-2)

- Current Weather Forecast Models and Systems
 - Provide local and regional weather forecasts
 - Assist General Public and Emergency Management officials
- Examples
 - NOAA Weather Forecast and Advisories (<http://www.noaa.org>)
 - Weather Channel (<http://www.weather.com>)
 - IBM's Deep Thunder (<http://www.research.ibm.com/weather/DT.html>)

Concerns

- Meteorologists' time spent on unnecessary tasks
 - Installation, Setup of WRF Model

Motivation(2-2)

- Concerns continued....
 - Unavailability of on demand higher resolution forecasts for end users
 - Business Owners and Emergency Management Officials
 - Lack of familiarity or expertise with WRF Model
 - Multiple Forecast simulation requests under impending weather hazards
 - Size of data & Scalability demands for high performance computing
 - Lack of necessary system level control
 - Efficient processing
 - Allocation of computational loads

Proposed Research (1-2)

- On-Demand Resource Ingenious Grid enabled Weather Forecast Visualizations
 - Utilizing High resolution Weather Forecast Models
 - Weather Research Forecast Model (WRF)
 - Ensembles for hurricanes
 - Refining Weather Visualization Algorithms
 - Designing and Utilizing Effective Grid Resource Utilization algorithms

Proposed Research (2-2)

- Goal:
 - An Easily Accessible Interface over highly scaleable infrastructure
 - Ensure separation of concerns
 - Emphasizing upon the weather forecasts rather than model installation and setup (Meteorologists)
 - Assist Emergency Management Officials, Meteorologists, Business Owners and the general public
 - Support on demand domain/asset specific high resolution weather forecast visualizations

Major Research Issues

- Weather Forecast Data Processing and Visualization
- On-demand Allocation of Grid Resources

Weather Forecast Data Processing & Visualization (1-2)

- Easily accessible Interface over highly scaleable infrastructure
- Research, Design and Development
 - Grid-enabled Weather Forecast Simulations and Visualizations
 - User-driven Visualization of weather and GIS data sets
 - Methodologies for on demand allocation of grid resources
 - Domain driven allocation
- Visualization techniques/methodologies
 - Colors
 - Shapes

Weather Forecast Data Processing & Visualization (2-2)

- Grid WRF Portal
 - Web based portal
 - Allows ensemble parameter configurations for hurricanes
 - Utilization of ensembles assists in resolving the uncertainty concerns
 - If - then scenarios
 - Interactive (Zoom In/Out) and Non-interactive (MPEG/GIFs) visualizations customized according to user profile and needs
 - Facilitates Domain/Assets Definition

On Demand Allocation of Grid Resources (1-3)

- Key Issue:
 - On Demand Distribution and processing of Computation Loads based on user request
- Multiple weather forecast simulation requests along with ensemble generation and simulation for rendering 2-D visualizations requires
 - Cluster/Grid-computing infrastructure
 - Simultaneous forecast simulation runs over grid nodes for different domains
 - Differentiating between domains of interest and non-interest
 - Near real time Acquisition of weather forecast data
 - Addressing Latency concerns by restricting data transfer to a minimum

On Demand Allocation of Grid Resources (2-3)

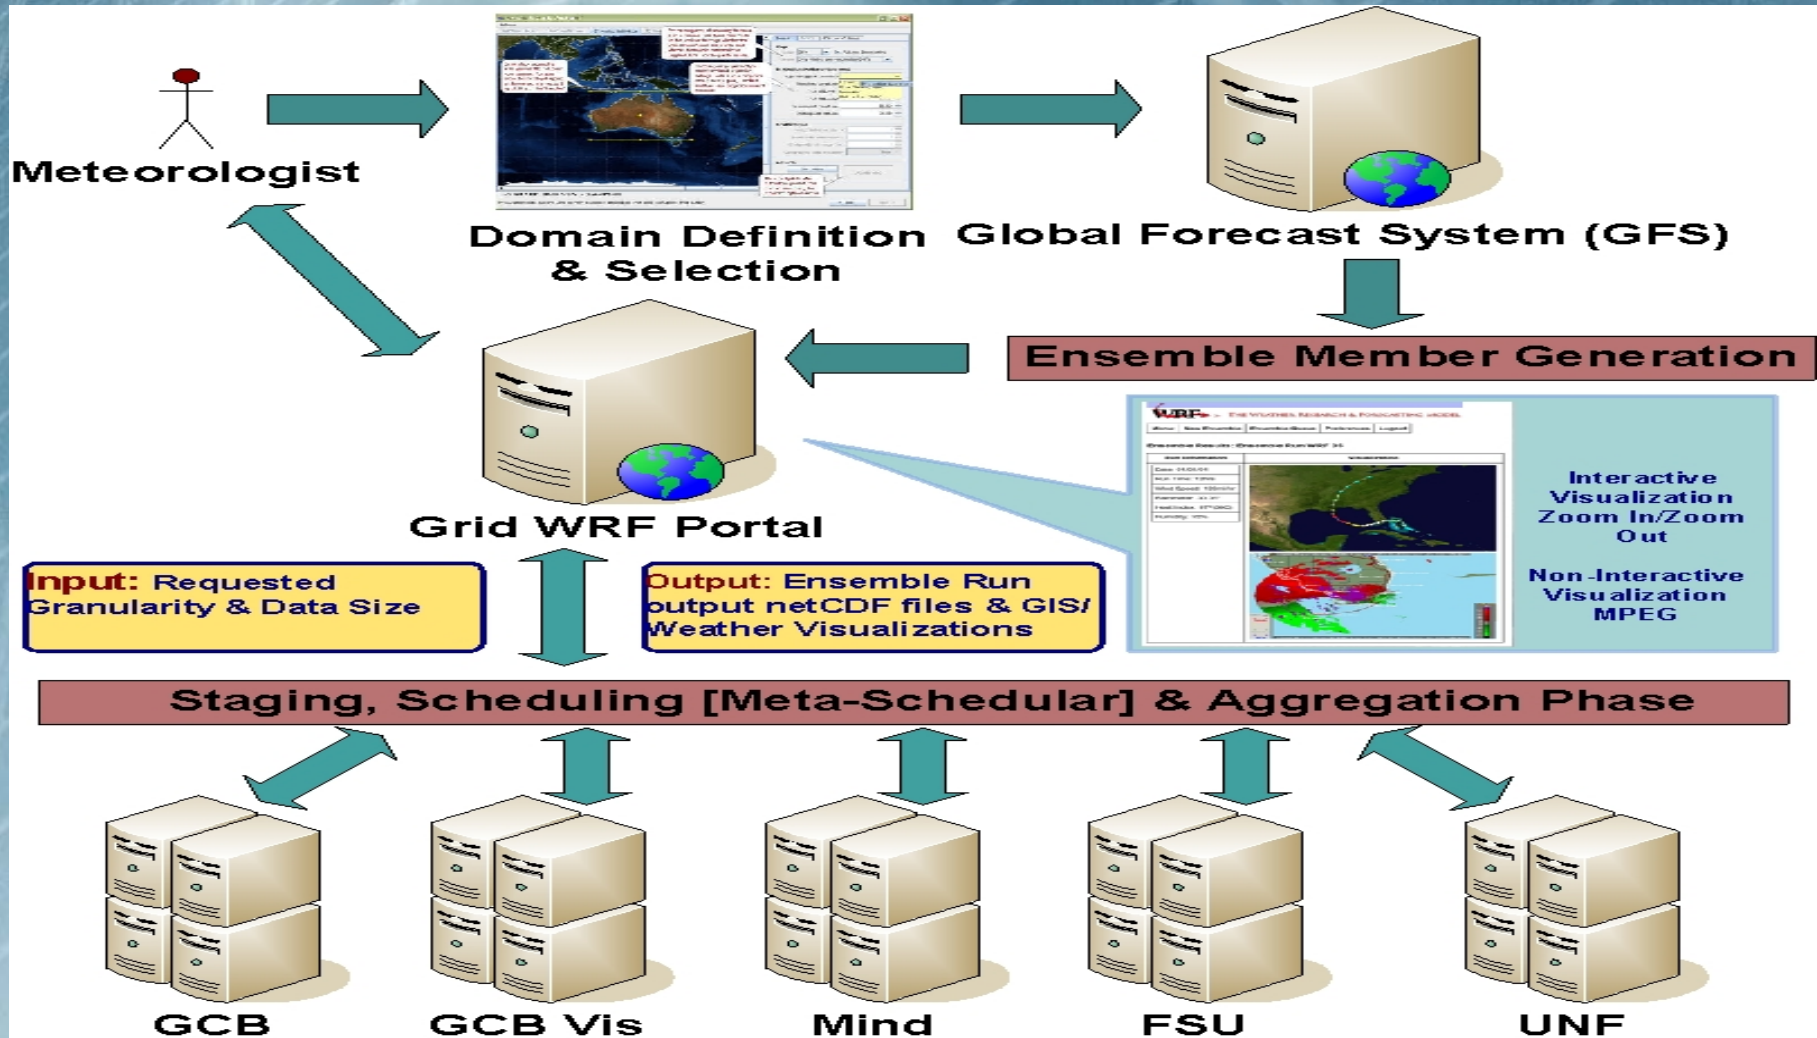

- On demand Scheduling, Simulation and Visualization of Weather Forecast data associated with GIS domains
 - Invoked via portal
 - Meta-scheduler for efficient dynamic allocation of Grid resources
- Employs VisAD for visualization purposes
- Google Maps used as base for GIS data
- Latency issue for visualization data
 - Addressed via the use of KML files

On Demand Allocation of Grid Resources (3-3)

- Grid WRF Portal Test Case (Hurricane Floyd)
 - Extraction of Atmospheric conditions from Global Forecast System (GFS) for three level nested Domain (15 km, 5 km and 1km)
 - 6 Member Ensembles script generation
 - Perturbation of WRF Parameters
 - Initial fields only
 - Geo-potential height
 - Wind velocity
 - Atmospheric pressure,
 - Temperature

Summary

- Web based portal
 - Facilitates Research over and Configuration of Weather Forecast Models
 - Generates On Demand simulations and visualizations over computing Grids
 - Dynamic Allocation of Grid Resources
 - In response to user requests

Future Work

- Facilitate representation of errors and uncertainty
- Deploying the Grid WRF Portal Test case
 - Execution of different ensemble members over two clusters
 - Involves staging/aggregation and visualization
 - Meta-Scheduler
 - Job Flow Manager
- Colors for effective and meaningful visualizations

Acknowledgements

- This work is supported by:
 - The National Science Foundation grant OCI-0636031 and REU-0552555.
 - IBM (SUR and Student Support awards).
- We would like to thank:
 - The CIARA staff and engineers support: Heidi Alvarez, Julio Ibarra, Ernesto Rubi, Diego Obina, Ileana Gonzalez, and Omaid Hennessey.
 - The SCIS system staff support: Steve Luis, Eric Johnson, Catherine Hernandez, and Chak Leung.

Question & Answers
